

WHAT IS CLAIMED IS:

1. An information processing apparatus comprising:
an accepting unit that accepts designation of a
destination to be associated with encoded information;
5 a storage that stores information to be
transmitted to the designated destination;
a extracting unit that extracts information of
identical/having an identical destination and type from
the information stored in said storage unit; and
10 a transmitter which batch-transmits the pieces of
information extracted by said extracting unit.
2. The apparatus according to claim 1, further
comprising a merging unit that merges the pieces of
information extracted by said extracting unit into a
15 smaller number of pieces of information,
wherein said transmitter transmits the
information merged by said merging unit to the
designated destination.
3. The apparatus according to claim 1, wherein said
20 transmitter transmits the extracted information by
originating calls fewer in number than the pieces of
extracted information.
4. The apparatus according to claim 4, wherein said
transmitter transmits the extracted information by
25 originating a single call.
5. The apparatus according to claim 1, wherein said
extracting unit further comprises:

O
R
T

 a first extracting component that extracts pieces of information having an identical destination from information stored in said storage unit; and

5 a second extracting component that extracts pieces of information of identical type from the pieces of information extracted by said first extracting component.

6. The apparatus according to claim 1, wherein the information processing apparatus is a color facsimile 10 apparatus, and the information is image data.

7. The apparatus according to claim 6, further comprising:

 a reader unit that reads image data; and
 a encoder unit that encodes by a predetermined 15 encoding method the image data read by said reader unit, wherein said extracting unit extracts encoded image data as the information.

8. The apparatus according to claim 7, further comprising a determining unit that determines whether a 20 plurality of image data read by said reader unit have a predetermined relationship to each other,

 wherein said encoder performs encoding by selecting an encoding method based on a determination made by said determining unit.

25 9. The apparatus according to claim 8, wherein the predetermined relationship is a relationship that is established when the plurality of image data are of the

same type.

10. The apparatus according to claim 9, wherein:
said determining unit determines that the plurality of data have the predetermined relationship whenever all the plurality of image data is monochrome image data; and
 11. The apparatus according to claim 10, wherein the binary encoding method is MH encoding.
 12. The apparatus according to claim 10, wherein the binary encoding method is MR encoding.
 13. The apparatus according to claim 10, wherein the binary encoding method is MMR encoding.
 14. The apparatus according to claim 10, wherein the binary encoding method is JBIG encoding.
 15. The apparatus according to claim 9, wherein
said determining unit determines that the plurality of data do not have the predetermined relationship whenever not all the plurality of image data is monochrome image data, and
said encoder encodes the plurality of image data by a multilevel encoding method.
 16. The apparatus according to claim 15, wherein the multilevel encoding method is JPEG encoding.
 17. An information processing apparatus comprising:
an input unit that inputs a destination for

encoded information;

a storage unit that stores pieces of information to be transmitted to the input destination;

an extracting unit that extracts information 5 identical destination and encoding method from the information stored in said storage; and

a transmitter that transmits the information extracted by said extracting unit.

18. The apparatus according to claim 17, further 10 comprising a merging unit that merges the pieces of information extracted by said extracting unit into a smaller number of pieces of information,

wherein said transmitter transmits the 15 information merged by said merging unit to the destination.

19. The apparatus according to claim 17, wherein said transmitter transmits the extracted information by call originating calls fewer in number than the extracted information.

20. An information processing apparatus comprising:

an input unit that inputs a destination to be associated encoded information;

a storage that stores pieces of information to be transmitted to the input destination;

25 an extracting unit that extracts pieces of information which are common in terms of destination from the pieces of information stored in said storage

unit;
a classifying unit that classifies the information extracted by said extracting unit according to information type;

5 a generator unit that generates an information group constituted by information of the same type; and
 a transmitter that transmitting the information for each of generated information groups.

21. The apparatus according to claim 20, wherein said
10 transmitter transmits the extracted information by call originations fewer in number than the pieces of information.

22. The apparatus according to claim 21, wherein said transmitter transmits the pieces of extracted
15 information by originating a single call.

23. An information processing method comprising the steps of:

accepting designation of a destination associated with encoded information;

20 storing information to be transmitted to the accepted destination;

 extracting pieces of information of identical destination and type from information stored in information storing step; and

25 batch-transmitting the pieces of extracted information.

24. The method according to claim 23, further

T

comprising the step of merging the pieces of extracted information into a smaller number of pieces of information,

wherein, in the batch-transmitting step, the
5 merged information is transmitted to the destination.

25. The method according to claim 23, wherein in the batch-transmitting step, the extracted information is transmitted by call originations fewer in number than the pieces of extracted information.

10 26. The method according to claim 25, wherein in the batch-transmitting step, the extracted information is transmitted by originating a single call.

27. The method according to claim 23, wherein the extracting step comprises:

15 a first extracting step of extracting information of identical destination from information stored in the storing step; and

a second extracting step of extracting information of identical type from information
20 extracted in the first extracting step.

28. The method according to claim 23, wherein the information processing method is performed in/by a color facsimile apparatus, and the information is image data.

25 29. The method according to claim 28, further comprising the steps of:

reading image data; and

bb

encoding the read image data by a predetermined encoding method;

wherein, in the extracting step, the information extracted is encoded image data.

5 30. The method according to claim 29, further comprising the step of determining whether a plurality of image data read in the read step have a predetermined relationship to each other,

10 wherein, in the encoding step, encoding is performed by selecting an encoding method based on the determination made in the determining step.

31. The method according to claim 30, wherein the predetermined relationship is a relationship that is established when the plurality of image data is of the 15 same type.

32. The method according to claim 31, wherein:
in the determining step, it is determined that the plurality of data have the predetermined relationship whenever all the plurality of image data 20 are monochrome image data; and

in the encoding step, the plurality of monochrome image data is encoded by using a binary encoding method.

33. The method according to claim 32, wherein the binary encoding method is MH encoding.

25 34. The method according to claim 32, wherein the binary encoding method is MR encoding.

35. The method according to claim 32, wherein the

binary encoding method is MMR encoding.

36. The method according to claim 32, wherein the binary encoding method is JBIG encoding.

37. The method according to claim 31, wherein

5 in the determining step, it is determined that the plurality of data do not have the predetermined relationship whenever not all the plurality of image data are monochrome image data, and

10 in the encoding step, the plurality of image data are encoded by a multilevel encoding method.

38. The method according to claim 37, wherein the multilevel encoding method is JPEG encoding.

39. An information processing method comprising the steps of:

15 inputting a destination for encoded information; storing pieces of information to be transmitted to the input destination;

 extracting pieces of information of identical destination and encoding method from stored information; and

 transmitting the extracted information.

40. The method according to claim 39, further comprising the step of merging the pieces of extracted information into a smaller number of pieces of information,

25 wherein, in the transmitting step, the merged information is transmitted to the destination.

41. The method according to claim 39, wherein in the transmitting step the extracted information is transmitted by call originations fewer in number than the extracted information.

5 42. An information processing method comprising the steps of:

 inputting a destination for encoded information;

 storing the information to be transmitted to the input destination;

10 extracting pieces of information of identical destination from stored information;

 classifying the pieces of extracted information according to an information type so as to generate an information group constituted by pieces of information
15 of the same type; and

 transmitting the pieces of information for each generated information group.

43. The method according to claim 42, wherein in the transmitting step, the pieces of extracted information
20 are transmitted by call originations fewer in number than the pieces of information.

44. The method according to claim 43, wherein in the transmitting step the pieces of extracted information are transmitted by originating a single call.

25 45. A storage medium storing a program code which can be executed on a computer, including:

 a program code for inputting a destination of

encoded information;

a program code for storing information to be transmitted to the input destination;

5 a program code for extracting pieces of information of identical destination and type from the information stored in the storage step; and

a program code for batch-transmitting the extracted information.

46. A storage medium storing a program code which can 10 be executed on a computer, including:

a program code for inputting a destination for encoded information;

a program code for storing the information to be transmitted to the input destination;

15 a program code for extracting information of identical destination from stored information;

a program code for classifying the extracted information according to an information type so as to generate an information group constituted by 20 information of the same type; and

a program code for transmitting the information for each of generated information groups.
